

■ AEO Pipeline Milestone

Intern Team Update · Technical Milestone Report

Hey everyone — big milestone to share. This week we went from zero to a **fully working, end-to-end AI content auditing system** that runs entirely on our own machines. No cloud. No API subscriptions. No cost. Here's what we built and why it matters.

\$0	6,500	3.9s	4	8
Monthly API Cost	Words Scraped in First Test	Extraction Time (Pentera)	AEO Rubric Criteria Scored	Competitors in Pipeline

■ What We Built

■ The Database

A local **PostgreSQL** database serves as the single source of truth for the entire pipeline — storing clients, all 8 competitors, every scraped page, and every AI-generated audit score in a clean relational schema.

■ The Scraper

A headless Python scraper powered by **Playwright** navigates real enterprise websites — including those with bot protection — and extracts clean Markdown text directly into the database. **Live test: 6,500 words from Pentera extracted in 3.9 seconds.**

■ The Brain

A local **Phi-3 SLM** (Small Language Model) running via Ollama reads the scraped content and grades it against a strict 4-point AEO rubric, outputting results as structured JSON. Zero API calls. Runs entirely on our own hardware.

■ The AEO Rubric — How Phi-3 Scores Each Page

#	Criterion	What Phi-3 Checks For	Max Score
1	H1 Question	Is the H1 heading a real customer question ending with '?'	10 / 10
2	TLDR Present	Does a direct, jargon-free answer appear in the first 2-3 sentences?	10 / 10
3	Statistical Citations	Does the page include at least one concrete stat, number, or data point?	10 / 10
4	Conversational Tone	Is the writing direct and human? Penalises marketing fluff.	10 / 10

■ Why This Actually Matters

■ Hours of Manual Work Eliminated Auditing a competitor's content quality by hand takes 30–60 minutes per page. This pipeline does it in seconds, automatically, across every competitor at once.	■ Zero Cost to Run at Scale No OpenAI bill. No Anthropic credits. No Gemini quota. We can run this across hundreds of pages every week and the marginal cost is literally \$0.	■ Complete Data Privacy Every scraped page, every score, every competitive insight stays on local hardware. No data is sent to a third-party server at any point in the pipeline.
--	---	--

■ What's Next

01 Expand the Scraper Run the scraper across the full competitive landscape — Securin's own pages plus all 7 remaining competitors. Populate the database with real-world content.	02 Batch the Scoring Run every scraped page through the Phi-3 Gap Analysis Agent to generate a full AEO score for each competitor. Build the complete competitive scoring matrix.	03 Build the Report Exporter Write a script that pulls JSON scores from the database and produces a clean CSV or Markdown report showing exactly where competitors win or lose in AI search visibility. Deliver the first competitive gap analysis.
---	--	--

Once the export script is done, we'll have a full automated competitive gap analysis — built, owned, and run entirely by this team. ■
